Examine Regulatory Compliance and Management System Conformance

Auditing examines a variety of process performance and reliability attributes. All types of business and operational processes demand a variety of audits and inspections to examine compliance with standards such as government regulations, industry codes, system standards (i.e., ISO standards), or internal company requirements.

Effective auditing program design, standardized procedures and trained/knowledgeable auditors, coupled with computerized systems and tools, can enable an organization to capture and analyze audit data, and use the information to improve business performance. This yields better compliance assurance, continual improvement and greater reliability in the implementation of management systems, internal controls, business processes, and operational practices.

Audits can be Tailored to Meet Several Needs such as:

- ISO 9001 (Quality)
- ISO 14001 (Environmental) Management Systems conformance
- OHSAS 18001 (Safety)
- Security: ISO 27001 (ISMS), ISO 28000 (Supply Chain) Auditing Services
- Industry focused requirements such as: FERC & NERC (utilities) RCMS® and RCI4001® (Chemical Industry); Joint Commission (Health Care)
- Regulatory Compliance—Environmental, Safety, Process Safety, Food Safety
- Sustainability—verification assessments

Kestrel Designs Audit Programs and Assists with Implementation:

- Audit program review, design, and improvement
- Internal auditor training and support
- Outsourced auditing services for management systems and compliance
- Electronic audit software and tools to collect, store, and manage work-place assessments, follow-up actions, and data analysis.
